                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                 The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activities activity, tissue growth factor activity, immunomodulatory activity and activity, insue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

```
This represents a first EcoR1 nucleotide fragment of human KIAA0180. This 5009 basepairs partial CDNA encodes for a protein of unknown function from myeblast cell line KG-1. The invention provides a human heart Ofucosyltransferase that can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated Ofucose residue. Inhibitors of Ofucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of Ofucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                241

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016176-ABL30513).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0 or more

This invention is related to a novel isolated canine nucleic acid sequences and the construction of canine microarrays containing a significant portion of the canine genome. The isolated canine nucleic cid sequences of the invention may be useful for drug screening and toxicity assays. The invention is therefore useful for assessing the impact, including toxicity, of a compound, pharmacoutical agent or impact, including toxicity, of a compound, pharmacoutical agent or convironmental pollutant on cell or living organism. The methods are useful for detecting genes that are up- or down-regulated in canines in a disease state. The sequences are useful as dismostic agents or markers to detect a cellular response in a sample individually or as part of a gene expression profile. It is also useful as a target for agents that modulate gene expression or activity. The database is useful for producing electronic Northerns that allow the user to determine the cell type or tissue in which a given gene is expressed and to allow type or tissue in which a given gene is expressed and to allow the abundance or expression level of a given gene in a

particular tissue or cell. The methods are ussful for determining the similarity of a toxic response to one or more individual compounds. The methods are useful for predicting at least one toxic response or the likelihood that a compound or test agent will induce various specific pathologies such as those of the liver (liver necrois, fatty liver disease, protein adduct formation or hepatitis), those of the kidney, heart, brain or testes, or other pathologies associated with at least of the toxins. The methods are also useful for predicting or elucidating the potential callular pathways influenced, induced or medilated by the compound or test agent due to the similarity of the expression profile compound or the profile induced by a known toxin. The present sequence is that of a canine plak sequence which was claimed for use during the profuce or a canine microarray of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     217
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    177

AMD07571-AMD07645 represent cnNAs corresponding to 25 human secreted protein genes, and AAE01055-AAE00116 represent the proteins they encode. AAE01127-AAE01150 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliotrating medical conditions. e.g., by protein or gene treating or ameliotrating medical conditions, e.g., by protein or gene conditions can be diagnosed by determining the presence of muctions in the new genes. Specific uses are described for each of the muttions in the new genes. Specific uses are described for each of the muttions in the new genes. Specific uses are described for each of the amount of the lisuses in which they are most highly expressed, and include developing products for the diagnosis or treatment of an include developing products for the diagnosis or treatment of anormalities, haematopoietic disorders, diseases of the immune system, ALDS, autoformune diseases, cancer, tummours, foetal and developmental anormalities, neurological disorders, schizophrenia, skin disorders disorders, angiogenic disorders, kidney disorders, and disorders, angiogenic disorders, kidney disorders, and disorders, pregnancy related disorders, ender or all disorders, angiogenic disorders, schizophrenia, asthma, skin disorders and sorders, pregnancy related disorders, ender or all devolutes, and confidential cell proliferation, to prevent skin aging due to sunburn, to

primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding CDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      305

                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nProPheGlyProPheTrpAspGlnPheHisValSerPheAsnLysSerGluLeuPheTh 143

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           321 TAGCCTTCAGCAGGAGAAGAACGATCCAGACAAGCCCAATTGCCACGCCAAGGATGGCAA 262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nProphedlyProPheTrpAspGlnPheHisValSerPheAsnLysSerGluLeuPheTh 143
                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical forugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins (ABBS7737) and ABR370712). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM82100 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polymuclectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased example, they may be used to treat disorders associated with decreased cyptosic or the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polymuclectides may be used to produce the secreted (1), by inserting the concleic acids into a host cell and culturing the cell to express the diagnose and treat immune/haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic-derived cells. AAK64703 to AAK87695 and AAM82169 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK84950 and AAM82169 represent suce in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GlnCysValGlyTyrSerArgSerThrAlaAlaProLeuThrMetThrMetCysLeuPro 262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acida encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10331 BP; 2718 A; 2405 C; 2599 G; 2609 T; 0 U; 0 Other;

Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 6032; 1297pp + Sequence Listing; English

The invention relates to an isolated polymuclectide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831 whose sequence was determined by the technique of SBH (sequencing by Mybridisation). Also included is a purified polymeptide comprising a sequence corresponding to a reading frame of the novel polymuclectide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in foremsics, in assessing biodiversities, or in identifying mutations in foremsics, in assessing biodiversities, or in identifying mutations captures are also useful as Mybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of the insequence and generating antisense DNA or RNA. The purifited polypeptide protein, or in generating antisense DNA or RNA. The purifited polypeptide is useful for generating antisense DNA or RNA. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at equation of comma directly from USPTO at equation of the sequence. Huml?PDcID=20030073623
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                     Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library
was normalized. Library was constructed by Life Technologies, a
division of Invitrogen. This sequence belongs to sequence cluster

EST project with full-length enriched cDNA libraries carried out in Animal Genome Research Program (Japan) by National Institute of Agrobiological Sciences and STAFF-Institute

Single pass sequencing of clones derived from oligo-capped CDNA library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vector sequences were eliminated by RepeatMasker version 2002/07/13 and crossmatch version 0.990319

Low quality bases were trimmed based on the quality values.

Ist strand CDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand CDNA was dispessed with Not I and cloned into the Not I and Ecox V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster For more information about this cluster. see http://www.genoscope.cns.fr/cdna?s=CSOAJO08DCO6QPI&C=9980.f.

1 st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime

and enriched, double-strand cDNA was digested with Not I and cloned

into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library

was not normalized. Library was constructed by Life Technologies, a

division of Invitrogen.

This sequence belongs to sequence cluster 9980.f

For more information about this cluster, see
